## Execution Time & Timestamps (gettimeofday)

```
#include <sys/time.h>

struct timeval t;
uint64_t start;

if (gettimeofday(&t, NULL) == 0)
{
    start = 1000000ULL * t.tv_sec + t.tv_usec;
} // if

:

if (gettimeofday(&t, NULL) == 0)
{
    printf("%llu us", (1000000ULL * t.tv_sec + t.tv_usec) - start);
} // if
```

The resolution of function `gettimeofday()` depends on the platform, but mostly all *Linux* like systems implement it using high resolution timers.

## Name of Current Process (getpid)

The following code fragment determines the executable name (possibly incl. path) of current process in variable `exe`.

```
#include <unistd.h>
#include <stdio.h>

char exe[256]; /* to be adopted, possibly by dynamic alloc */
char path[32]; /* path of 'exe' link in proc filesystem */
ssize_t len;

snprintf(path, sizeof(path), "/proc/%d/exe", (int) getpid()); /* not
portable */
buf[sizeof(path) - 1] = '\0';
len = readlink(path, exe, sizeof(exe));

if (len != -1)
    exe[len] = '\0';
else
    ; /* implement error handling */
```

The implementation works under *Linux* and some other \*nix derivates, but not for all systems (you might use `#ifdef __linux__` if this method is appropriate).

See man page `proc(5)` for details on *proc* filesystem under *Linux*.

## Change \*NIX User Password

```
int change_passwd ( const char* user, const char* oldpw, const char* newpw )
{
    int fds[2];
    int xstatus = EXIT_FAILURE; /* exit status */

    if ( pipe ( fds ) == 0 )
    {
        pid_t pid = fork ( );
        if ( pid >= 0 )
        {
            if ( pid == 0 ) /* in child process ? */
            {
                close ( fds[1] ); /* close write end */

                if ( dup2 ( fds[0], STDIN_FILENO ) >= 0 )

```

```
        execl ( "/usr/bin/passwd", "passwd", user, (char *) NULL
);
    }

    exit ( xstatus );
}
else
{
    int status; /* child status */
    ssize_t len = strlen ( newpw );

    close ( fds[0] );
    xstatus = EXIT_SUCCESS;

    if ( oldpw != NULL ) /* normal user (not root) ? */
    {
        if ( ( write ( fds[1], oldpw, strlen ( oldpw ) ) < 0 )
|| ( write ( fds[1], "\n", 1 ) != 1 ) )
        {
            xstatus = EXIT_FAILURE;
        }
    }

    if ( xstatus == EXIT_SUCCESS )
    {
        if ( ( write ( fds[1], newpw, len ) != len ) ||
( write ( fds[1], "\n", 1 ) != 1 ) ||
( write ( fds[1], newpw, len ) != len ) ||
( write ( fds[1], "\n", 1 ) != 1 ) )
        {
            xstatus = EXIT_FAILURE;
        }
    }

    close ( fds[1] );

    if ( waitpid ( pid, &status, 0 ) >= 0 )
    {
        if ( WIFEXITED ( status ) && ( xstatus == EXIT_SUCCESS ) )
        {
            xstatus = WEXITSTATUS ( status );
        }
    }
    else
    {
        kill ( pid, SIGKILL ); /* sanity */
    }
}
```

```
    }
}

return xstatus;
}
```
